

Scan-to-email stopped working? A fix sheet

Why copiers and scanners stop sending email, and the safe ways to get them working again.

Why it breaks

- **Your email provider stopped accepting a plain username and password** ("basic authentication"). Google Workspace ended it in 2025. Microsoft 365 already blocks it where "security defaults" are on. For everyone else, Microsoft plans to switch it off by default at the end of December 2026 (admins can turn it back on for a time) and to announce a final removal date in the second half of 2027.
- **MFA was turned on, or the password changed, on the mailbox the copier uses.** A copier cannot answer an MFA prompt.
- **Wrong port or encryption.** Microsoft 365: smtp.office365.com, port 587 (or 25), not 465, with STARTTLS. The copier must support TLS 1.2 or newer, so older copiers may need new firmware. Gmail: smtp.gmail.com, port 587 (TLS) or 465 (SSL).
- **The copier sends "as" your domain from somewhere your domain has not approved.** Your SPF and DMARC records tell other mail servers to junk or reject it. It often starts right after DMARC is tightened or the internet provider changes.

Safe ways to fix it, best first

- ☐ **Your provider's relay for devices.** It accepts mail only from your office's static public IP address (ask your internet provider for one), so no mailbox password sits in the copier. Google Workspace: the SMTP relay service (smtp-relay.gmail.com), which Google calls the most secure option. Microsoft 365: SMTP relay through a connector (port 25). Microsoft also says to add that IP to your SPF record.
- ☐ **A dedicated, authenticated sending service.** The copier signs in with its own login, never a person's mailbox. Microsoft suggests High Volume Email (recipients inside your company only) or Azure Communication Services Email (inside and outside). Both are pay-as-you-go. Approve whichever service you use in your SPF record and turn on DKIM, so the mail passes DMARC.
- ☐ **Modern sign-in (OAuth) on the copier.** Ask your dealer whether a firmware update adds it for Microsoft 365 or Google.
- ☐ **App passwords, only where your provider still supports them.** Google: still available, but they need 2-Step Verification, your admin can switch them off, they stop working when the account password changes, and Google does not recommend them. Microsoft 365: off by default, and they do not work on accounts that require modern sign-in. Check with your email provider first. Use a dedicated scanner mailbox, never a person's.
- ☐ **Skip email.** Scan to a shared folder or to cloud storage (OneDrive, SharePoint, Google Drive). Often the most reliable fix.

Please do not

- Turn off MFA on a person's mailbox to make the copier work.
- Re-enable basic authentication, switch off security defaults, or use an unknown mail server as the long-term fix.

Have ready: your email provider and admin, whether you have a static IP, the copier model and firmware, and the exact error on the panel.

Checked against vendor documentation on Sep 18, 2026. Providers change these rules, so check with your email provider. Guides: [Microsoft: send email from a multifunction device](#) · [Google: send email from a printer or scanner](#)
